Integrating EV Data From Chargers & Other Sources

AssetW**Q**RKS

In 2022, OEM Order Books Opened for EVs Across All Duty-Cycles

Procurement is not the finish line

Gasoline asset and fuel mgmt.
 requirements apply to EVs too

• Key considerations:

- Managing and tracking fuel costs
- Tracking vehicle lifecycle costs
- Billing back to internal departments
- Addressing both internal and external charging transactions

Fleet Charging Offerings Vision and Direction

- Multi-network, multi-solution environments
- Deploying unique, tailored solutions for:
 - Fleet
 - ----> Light-Duty
 - ----> Heavy-Duty
 - $\dashrightarrow \mathsf{Off}\mathsf{-}\mathsf{Road}$
 - Public
 - Workplace
 - Advanced use-cases (V2X, DERS)

Electricity is a fuel unlike any other....

• Different sources

- Grid
- Distributed resources (e.g., solar)

• Different rates

- Each facility may have a different utility rate structure
 - Rates can change seasonally
 - Locations with dedicated meters may use special EV-only rates

• Average cost per KWH will change based on:

- Time-of-use
- Peak demand at each meter every month
- Other factors

Integration Examples

Other Commercial Fuel Upload Options

M5

- Interface Module: Load fuel transactions from file. Requires standard Interface License.
- <u>API Module</u>: Commercial fuel can be imported via AssetProductIssue with license.
- Smart App Commercial Fuel Entry: Operators use manual entry in the app which interfaces into FleetFocus with license.

FA

- Fuel Data Load: Load transactions from file. No license required.
- <u>API Module</u>: Commercial fuel can be imported via AssetProductIssue with license.
- Smart App Commercial Fuel Entry: Operators use manual entry in the app which interfaces into FleetFocus (license required).

Charger Integration- The Driver Experience

Driver pulls up to integrated

Vehicle is charged and all relevant data, including date and time of charge session, actual time of charge versus plug-in time, total kilowatts consumed and kilowatt per hour cost, is imported.

All data is ready for reporting

Cost and Usage Analysis- Segmentation

✓ Internal Departments

✓ Asset Class or Individual Vehicles

✓ Location

Addresses and Tracks Variability

• Different Sources

- Grid
- Distributed Resources (PV, Co-gen)
- Different Rates
 - Each facility may have a different utility rate structure
 - Rates can change seasonally
- Average cost per KWH will change based on changes in usage due to
 - ----> Time-of-use
 - ---> Overall demand
 - \rightarrow Other factors
- Very possible to spend more electricity than gas/diesel

See Impact of Management Decisions

Despite cost complexity, can manage many aspects to shape price

Can Control

- Time of charging
- Speed of charging (power)
- Utility rate type
- Electricity source
- Peak demand

Can't Control

- Number of shifts
- Duty-cycle requirements
- Utility rate design

Consider Different 'Types' of Electricity

180KW off grid DC Fast Charger and genset supporting transit fleet ops

Fuel Cost Variability

Charging costs are difficult to track without software and impossible to analyze/segment without integration. Key cost components are generally:

Time-of-Use Rates

- Vary by time and can increase the costs by 3x
- Encourages charge scheduling

• Peak Demand Charges

- Tripped by peak electricity use in a 15- or 30minute period.
- Can be majority of electricity cost
- Requires additional hardware to monitor
- Encourages load balancing

Light Duty Fuel Cost Example

- Ten F -150s (300mile range)
- Need to fill from 15% to 100% (153.6 KW)
- Takes 8 hours (80amps)
- Assume Demand Holiday Rate

Bad Time of Use Example

	One Truck Cost	Ten Truck Cost
Time of Use 4-9 PM (\$0.35 per kwh)	\$33.60	\$336.00
Time of Use 9pm- 12am (\$0.14 per kwh)	\$8.06	\$80.60
1 Night Total	\$41.66	\$416.60

Good Time of Use Example

	One Truck Cost	Ten Truck Cost
Time of Use 9pm- 5am (\$0.14 per kwh)	\$21.50	\$215.00

Scheduled Charging Scenario with 50% Reduction in Costs

HD Fuel Cost Example

Example: Fifty Class 8 trucks at a LA area facility using no more than forty 150kw DCFC at a time										
Rate Type	Time of Use	Demand	Total Bill	Cost per kWh	Notes					
Demand Holiday Year 1-5	\$636,364	\$0	\$639,424	\$0.15	Approx. 46% of energy costs from					
Demand Holiday Year 11	\$525,505	\$437,338	\$965,904	\$0.22	demand charges at full imposition in Year 11.					
тои	\$350,796	\$883,764	\$1,237,621	\$0.28	Approx. 71% of energy costs from demand charges					
Demand Subscription	\$725,817	\$70,964	\$796,781	\$0.18						

AssetWorks Insight- "Mileage May Vary: Time of use and demand rates are difficult to estimate. Actuals may vary significantly from forecast amounts. EV charging at scale is almost impossible to monitor and manage without charging software integrations.

S Pricing

🖏 Help

Configure pricing to match real-world

- Set pricing based on:
 - ✓ Seasonal utility rates
 - ✓ Locations/Meters/Utility Service Areas
 - ✓ Type of Charging (AC v DC)
 - ✓ Specific chargers
 - ✓ Driver behavior

Third Party Charger Integration Process

Closing Thoughts on Integration

- Electricity is complex and difficult to manage without software
- Integrate "when small and early"
- Understand what charging systems your
 FIMS provider supports and doesn't
